

Presentation 1 - Seminar 3

**Presentation 1.** Let  $ABCD$  be a parallelogram. Let  $X$  and  $Y$  be points on the sides  $AB$  and  $BC$ , respectively, such that  $AX = CY$ . Prove that the intersection of lines  $AY$  and  $CX$  lies on the angle bisector of  $\angle ADC$ .

Law of sines:

$$\frac{a}{\sin(A)} = \frac{b}{\sin(B)} = \frac{c}{\sin(C)} \quad \Leftrightarrow \quad \frac{\sin(A)}{a} = \frac{\sin(B)}{b} = \frac{\sin(C)}{c}$$

3. We know from the hypothesis that  $AX$  and  $CY$  are equal so now is the time to use that and change  $AP$  and  $PC$  in terms of  $AX$  and  $CY$  using the law of sines:

2. Since we know those two angles we can use that to our advantage and apply the Law of sines as following:

$$AP = \frac{\sin(\angle AXP)}{\sin(\angle APX)} \cdot AX$$

$AX$  and  $CY$  equal so we might cancel them out so we only remain with: 4.

We also know that  $\angle APX = \angle CPY$  from the intersection of  $AY$  with  $CY$

If two angles add up to  $180^\circ$  it means their sin are equal.

Or they can have the same angle.

1. Using parallel lines in  $AB$  and  $DC \Rightarrow \angle DCP = \angle PXB$   
 $\Rightarrow \angle PXB = 180^\circ - \angle AXP$   
 and the same for  $AD$  and  $BC \Rightarrow \angle PYC = 180^\circ - \angle DAP$   
 We can deduce that:  
 $\angle DAP = 180^\circ - \angle PYC$   
 $\angle DCP = 180^\circ - \angle AXP$

$$\frac{\sin(\angle ADP)}{AP} = \frac{\sin(\angle DAP)}{DP} \Rightarrow \sin(\angle ADP) = \frac{\sin(\angle DAP)}{DP} \cdot AP$$

$$\frac{\sin(\angle CDP)}{PC} = \frac{\sin(\angle DCP)}{DP} \Rightarrow \sin(\angle CDP) = \frac{\sin(\angle DCP)}{DP} \cdot PC$$

$$PC = \frac{\sin(\angle PYC)}{\sin(\angle CPY)} \cdot CY$$

$$4. \sin(\angle ADP) = \frac{\sin(\angle DAP)}{DP} \cdot \frac{\sin(\angle AXP)}{\sin(\angle APX)}$$

$$\sin(\angle CDP) = \frac{\sin(\angle DCP)}{DP} \cdot \frac{\sin(\angle PYC)}{\sin(\angle CPY)}$$

Using:  
 $\sin(\angle DAP) = \sin(\angle PYC)$   
 $\sin(\angle DCP) = \sin(\angle AXP)$   
 $\sin(\angle APX) = \sin(\angle CPY)$  (equal angles)

We proved that  $\sin \angle ADP = \sin \angle CDP$   
 We know that  $ABCD$  is a parallelogram and the angle  $ADC$  is smaller than  $180^\circ$ .

$\Rightarrow$  It results that the line that passes through  $DP$ ,  $P$  being the intersection of  $XC$  with  $AY$ , is the angle bisector  $\angle ADP = \angle CDP$
